

Universal Flat Mount Bracket Kit

Thank you for purchasing SOLARLAND products. SLB-0123 mounting kits are designed to mount one panel with bottom support for better structure stability.(see in chart for size fitting)

Components and Parts

Part

 A-698 Component: Fixed Bracket Material: Aluminum Alloy Size: 27.5×1.97×1.1in Quantity: 2		 B-747 Component: Fixed Bracket Material: Aluminum Alloy Size: 29.4×3.3×1.9in Quantity: 2	
 C-482A Component: Fixed Bracket Material: Aluminum Alloy Size: 19×1.6×1.1in Quantity: 2		 D-104L/R Component: Tilt Arm Material: Aluminum Alloy Size: 4.1×3×2.5in Quantity: 2/2	
 M6/M8 Component: Tilt Arm Material: Stainless Steel Size: M6:6×18mm M8:8×20mm Quantity: 4/18		Fit Model: SLP U Series panels (50W to 180W) SLP C1D2 Series panels (45W to 150W) SLP CSA Series panels (50W to 60W)	

*(M6) all 4 mounting bolts will be used to install A-698(fixed bracket) to the PV module frame. Place 1 mounting bolt on each of the 4 sides of the PV module frame.

*(M8) mounting bolts-all 18 will be used to install the entire mounting bracket. Parts A-698,B-747,C-482A and D-104L/R will require the use of M8 mounting bolt.

Caution: If additional holes on the frame of the PV Module are needed, great care must be taken when drilling. Otherwise, damage to the module can easily occur rendering it useless. You may find it helpful to lubricate the nut and bolt to facilitate an easy removal at a later date.

Step 1. Assemble fixed bracket (A-698) and align with the designated holes along the PV module frame. Use mounting bolts (M6) to install onto the PV module frame. Screw one mounting bolt on each corner of the PV module frame. Gather fixed bracket (B-747) along tilt arm (D-104L/R) designated for left and right and align holes for installation onto the fixed bracket. The fixed bracket (B-747) will serve as the top portion of mounting kit. Use four mounting bolts (M8) to screw into the tilt arm (D-104L/R) and attach both fixed brackets together (A-698) (B-747). Once done, the top portion of mounting bracket is completed.

Please note: Tilt arm (D-104L/R) with arc holes can be adjusted according to the mounting holes on the fixed bracket. The tilt arm can be placed face in or out to maximize the distance for the PV Module as desired. See figure 1 for illustration.

Step 2. Gather fixed bracket (C-482A) and align with designated holes along the frame of the PV module for the desired tilt angle. Install one mounting bolt on each side to connect to the PV module frame. Then install the fixed bracket (B-747) along with tilt arm (D-104L/R) to fixed bracket (C-482A). Once done, the bottom portion of mounting kit will be completed.

To adjust the tilt angle of the PV panel, change the location of mounting bolts in the arc holes of tilt arm. Remember to use lock washers to prevent vibration from working them loose.

Step 3. See figure 2 for wall, use at least 8 fastening points with mounting bolts, washers, lock washers and nuts if possible. Otherwise, use wood screw, sheet metals, anchors or molly bolts (not included in kit).

Use steel clamps or U bolts (purchase separately) on pole mounting (figure 3). For better strength and stability, U-bolts are required for panels with a total weight of 25lbs or more.

Step 4. Be sure to seal all roof or wall penetrations with a compatible weatherproof sealant.
